DESCRIPTION

Pyrazolo[1,5-a]pyrimidine derivatives

Field of the Invention

The present invention relates to novel compounds, their use in the inhibition of protein kinases, their use in medicine and particularly in the prevention and/or treatment of a wide variety of diseases including inflammatory disorders, cancer, angiogenesis, diabetes and neurological disorders. The invention also provides processes for the manufacture of said compounds, compositions containing them and processes for manufacturing such compositions.

Background Art

Protein kinases are a family of enzymes that catalyse the phosphorylation of hydroxyl groups in proteins. Approximately 2% of the genes encoded by the human genome are predicted to encode protein kinases. The phosphorylation of specific tyrosine, serine, or threonine residues on a target protein can dramatically alter its function in several ways including activating or inhibiting enzymatic activity, creating or blocking binding sites for other proteins, altering subcellular localisation or controlling protein stability. Consequently, protein kinases are pivotal in the regulation of a wide variety of cellular processes, including metabolism, proliferation, differentiation and survival (Hunter, T. Cell, 1995, 80, 224-236). Of the many different cellular functions known to require the actions of protein kinases, some represent targets for therapeutic intervention for certain disease (Cohen, P. Nature Rev. Drug Disc., 2002,

1, 309-315).

It is known that several diseases arise from, or involve, aberrant protein kinase activity. In humans, protein tyrosine kinases are known to have a significant role in the development of many diseases including diabetes, cancer and have also been linked to a wide variety of congenital syndromes (Robertson, S. C. Trends Genet. 2000, 16, 265-271). Serine/threonine kinases also represent a class of enzymes, inhibitors of which are likely to have relevance to the treatment of cancer, diabetes and a variety of inflammatory disorders (Adams, J. L. et al. Prog. Med. Chem. 2001, 38, 1-60).

One of the principal mechanisms by which cellular regulation is affected is through the transduction of extracellular signals across the membrane that in turn modulate biochemical pathways within the cell. Protein phosphorylation represents one course by which intracellular signals are propagated from molecule to molecule resulting finally in cellular responses. These signal transduction cascades are regulated and often overlapping as evidenced by the existence of many protein kinases as well as phosphatases. It is currently believed that a number of disease and/or disorders are a result of either aberrant activation or inhibition in the molecular components of kinase cascades.

Three potential mechanisms for inhibition of protein kinases have been identified thus far. These include a pseudo-substrate mechanism, an adenine mimetic mechanism and the locking of the enzyme into an inactive conformation by using surfaces other than the active site (Taylor, S. S. Curr. Opin. Chem. Biol. 1997, 1, 219-226). The majority of inhibitors identified/designed to date act at the ATP-binding site. Such ATP-competitive inhibitors have demonstrated selectivity by virtue of their ability to target the more poorly conserved areas of the ATP-binding site (Wang, Z. et al.

Structure 1998, 6, 1117-1128).

There exists a need for the provision of further compounds that are inhibitors of protein kinases.

MAPKAP-K2 (mitogen-activated protein kinase-activated protein kinase 2) is a serine/threonine kinase that operates immediately downstream of the p38 kinase in the stress-induced MAPK pathway (Figure 1).

The p38 kinase pathway is involved in transducing the effects of a variety of stress-related extracellular stimuli such as heat shock, UV light, bacterial lipopolysaccharide, and pro-inflammatory cytokines. Activation of this pathway results in the phosphorylation of transcription and initiation factors, and affects cell division, apoptosis, invasiveness of cultured cells and the inflammatory response (Martin-Blanco, Bioessays 22, 637-645 (2000)).

p38 kinase itself activates a number of protein kinases other than the MAPKAP kinases such as Mnk1/2, PRAK and MSK1 (Figure 1). The specific and/or overlapping functions of the majority of these targets have yet to be resolved. This pathway has been of particular interest for the discovery of new anti-inflammatory agents. Previous strategies to intervene this pathway have involved the development of selective inhibitors of p38 kinase. Such inhibitors are effective both for inhibiting pro-inflammatory cytokine production in cell-based models and animal models of chronic inflammations (Lee et al., Immunopharmacology 47, 185-201 (2000)). p38 kinase knockout mouse is embryonic lethal. And cells derived from such embryos have demonstrated a number of abnormalities in fundamental cell responses. These observations indicate that caution should be paid to the long-term therapy with p38 kinase inhibitors.

An alternative strategy for the development of anti-inflammatory agents could be the inhibition of this pathway at the level of MAPKAP-K2. Human MAPKAP-K2 has two proline-rich domains at its N-terminus followed by the kinase domain and the C-terminal regulatory domain. This kinase has low homology with other serine/threonine kinases except MAPKAP-K3 and -K4. The C-terminal regulatory domain contains a bipartite nuclear localisation signal and a nuclear export signal. The crystal structure of inactive MAPKAP-K2 has been resolved (Meng, W. et al. *J. Biol. Chem.* 277, 37401-37405 (2002)). Activation of MAPKAP-K2 by p38 kinase occurs via selective phosphorylation of threonine residues 222 and 334 (Stokoe et al., *EMBO J.* 11, 3985-3994 (1992)). MAPKAP-K2 has an amphiphilic A-helix motif located within its C-terminal region that is likely to block the binding of substrates. The dual phosphorylation by p38 kinase has been proposed to reposition this motif resulting in enhanced catalytic activity (You-Li et al., *J. Biol. Chem.* 270, 202-206 (1995)). MAPKAP-K2 is present in the nucleus of unstimulated cells, and translocates to the cytoplasm upon cell stimulation. This kinase is known to phosphorylate a number of nuclear transcription factors as well as cytosolic proteins such as heat shock proteins and 5-lipoxygenase (Stokoe et al., *FEBS Lett.* 313, 307-313 (1992), Werz, et al., *Proc. Natl. Acad. Sci. USA* 97, 5261-5266 (2000), Heidenreich, et al., *J. Biol. Chem.* 274, 14434-14443 (1999), Tan, et al., *EMBO J.* 15, 4629-4642 (1996), Neufeld, *J. Biol. Chem.* 275, 20239-20242 (2000)). All such substrates contain a unique amino acid motif (XX-Hyd-XRXXSXX, where Hyd is a bulky hydrophobic residue) that is required for efficient phosphorylation by MAPKAP-K2 (Stokoe et al., *Biochem. J.* 296, 843-849 (1993)).

Currently MAPKAP-K2 is the only p38 kinase substrate for which a specific

function has been identified. A specific role for MAPKAP-K2 in mediating the inflammatory response has been strongly indicated by the phenotype of the MAPKAP-K2-deficient mouse (MAPKAP-K2^{-/-}) (Kotlyarov, et al., Nature Cell Biol. 1, 94-97 (1999)). This mouse is viable and normal except for a significantly reduced inflammatory response. Recently it has also been shown that MAPKAP-K2 deficiency results in a marked neuroprotection from ischaemic brain injury (Wang et al., J. Biol Chem. 277, 43968-43972 (2002)). MAPKAP-K2 is believed to regulate the translation and/or stability of important pro-inflammatory cytokine mRNAs. It is thought to function via phosphorylation of proteins that bind to the AU-rich elements found within untranslated regions of these cytokines. The identity of these proteins is currently under investigation.

MAPKAP-K2 therefore represents an intervention point in the stress-induced kinase cascade for perturbation of the inflammatory response.

Such organic bases are already well known in the art and may include amino acids such as arginine and lysine, mono-, di-, or trihydroxyalkylamines such as mono-, di-, and triethanolamine, choline, mono-, di-, and trialkylamines, such as methylamine, dimethylamine, and trimethylamine, guanidine; *N*-methylglucosamine; *N*-methylpiperazine; morpholine; ethylenediamine; *N*-benzylphenethylamine; tris(hydroxymethyl) aminomethane; and the like.

Salts may be prepared in a conventional manner using methods well known in the art. Acid addition salts of said basic compounds may be prepared by dissolving the free base compounds of the invention in aqueous or aqueous alcohol solution or other suitable solvents containing the required acid. Where a compound of the invention contains an acidic function, a base salt of said compound may be prepared by reacting said compound with a suitable base. The acid or base salt may separate directly or can be obtained by concentrating the solution *e.g.* by evaporation. The compounds of this

invention may also exist in solvated or hydrated forms.

The invention also extends to a prodrug of the aforementioned compounds such as an ester or amide thereof. A prodrug is any compound that may be converted under physiological conditions or by solvolysis to any of the compounds of the invention or to a pharmaceutically acceptable salt of the compounds of the invention. A prodrug may be inactive when administered to a subject but is converted *in vivo* to an active compound of the invention.

The compounds of the invention may contain one or more asymmetric carbon atoms and may exist in racemic and optically active forms. The compounds of the invention may exist in trans or cis form. The first aspect of the invention covers all of these compounds.

A compound of formula I may undergo one or more further reactions to provide a different compound of formula I. For example, a compound may undergo a reduction, oxidation, elimination, substitution and/or addition reaction.

Figure 2 - 8 shows a general reaction scheme for the preparation of compounds of Formula I.

The compounds of formula V, VI, VII and VIII are either known or can be prepared by methods analogous to those known for preparing analogous known compounds.

Other methods will be apparent to the chemist skilled in the art, as will the methods for preparing starting materials and intermediates. The Examples also make apparent various methods of preparing compounds of the invention as well as starting materials and intermediates.

In a fourth aspect, the present invention provides a composition comprising a compound of the invention in combination with a pharmaceutically acceptable carrier, diluent or excipient.

The composition may also comprise one or more additional active agents, such as an anti-inflammatory agent (for example a p38 inhibitor, glutamate receptor antagonist, or a calcium channel antagonist), a chemotherapeutic agent and/or an antiproliferative agent.

Suitable carriers and/or diluents are well known in the art and include pharmaceutical grade starch, mannitol, lactose, magnesium stearate, sodium saccharin, talcum, cellulose, glucose, sucrose, (or other sugar), magnesium carbonate, gelatin, oil, alcohol, detergents, emulsifiers or water (preferably sterile). The composition may be a

mixed preparation of a composition or may be a combined preparation for simultaneous, separate or sequential use (including administration).

The composition according to the invention for use in the aforementioned indications may be administered by any convenient method, for example by oral (including by inhalation), parenteral, mucosal (*e.g.* buccal, sublingual, nasal), rectal or transdermal administration and the compositions adapted accordingly.

For oral administration, the composition can be formulated as liquids or solids, for example solutions, syrups, suspensions or emulsions, tablets, capsules and lozenges.

A liquid formulation will generally consist of a suspension or solution of the compound or physiologically acceptable salt in a suitable aqueous or non-aqueous liquid carrier(s) for example water, ethanol, glycerine, polyethylene glycol or an oil. The formulation may also contain a suspending agent, preservative, flavouring or colouring agent.

A composition in the form of a tablet can be prepared using any suitable pharmaceutical carrier(s) routinely used for preparing solid formulations. Examples of such carriers include magnesium stearate, starch, lactose, sucrose and microcrystalline cellulose.

A composition in the form of a capsule can be prepared using routine encapsulation procedures. For example, powders, granules or pellets containing the active ingredient can be prepared using standard carriers and then filled into a hard gelatin capsule; alternatively, a dispersion or suspension can be prepared using any suitable pharmaceutical carrier(s), for example aqueous gums, celluloses, silicates or oils and the dispersion or suspension then filled into a soft gelatin capsule.

Compositions for oral administration may be designed to protect the active

ingredient against degradation as it passes through the alimentary tract, for example by an outer coating of the formulation on a tablet or capsule.

Typical parenteral compositions consist of a solution or suspension of the compound or physiologically acceptable salt in a sterile aqueous or non-aqueous carrier or parenterally acceptable oil, for example polyethylene glycol, polyvinyl pyrrolidone, lecithin, arachis oil or sesame oil. Alternatively, the solution can be lyophilised and then reconstituted with a suitable solvent just prior to administration.

Compositions for nasal or oral administration may conveniently be formulated as aerosols, drops, gels and powders. Aerosol formulations typically comprise a solution or fine suspension of the active substance in a physiologically acceptable aqueous or non-aqueous solvent and are usually presented in single or multidose quantities in sterile form in a sealed container, which can take the form of a cartridge or refill for use with an atomising device. Alternatively the sealed container may be a unitary dispensing device such as a single dose nasal inhaler or an aerosol dispenser fitted with a metering valve which is intended for disposal once the contents of the container have been exhausted. Where the dosage form comprises an aerosol dispenser, it will contain a pharmaceutically acceptable propellant. The aerosol dosage forms can also take the form of a pump-atomiser.

Compositions suitable for buccal or sublingual administration include tablets, lozenges and pastilles, wherein the active ingredient is formulated with a carrier such as sugar and acacia, tragacanth, or gelatin and glycerin.

Compositions for rectal or vaginal administration are conveniently in the form of suppositories (containing a conventional suppository base such as cocoa butter), pessaries, vaginal tabs, foams or enemas.

Compositions suitable for transdermal administration include ointments, gels, patches and injections including powder injections.

Conveniently the composition is in unit dose form such as a tablet, capsule or ampoule.

In a fifth aspect, the present invention provides a process for the manufacture of a composition according of the invention which comprises admixing one or more compounds of the invention with one more pharmaceutically acceptable excipients, carriers or diluents. The manufacture can be carried out by standard techniques well known in the art and involves combining a compound according to the first aspect of the invention and the pharmaceutically acceptable carrier or diluent. The composition may be in any form including a tablet, a liquid, a capsule, and a powder or in the form of a food product, *e.g.* a functional food. In the latter case the food product itself may act as the pharmaceutically acceptable carrier.

In a sixth aspect, the present invention provides a compound or composition of the invention, for use in medicine.

The compounds of the present invention are inhibitors of protein kinases such as mitogen-activated protein kinases, particularly mitogen-activated protein kinase-activated protein kinase 2 (MAPKAP-K2), or cyclin dependent kinases (CDK) *e.g.*, CDK1 and CDK2. Preferably, the compounds of the invention inhibit MAPKAP-K2 or CDK selectively (*i.e.*, the compounds of the present invention show greater activity against one kinase than the other). For the purpose of this invention, an inhibitor is any compound which reduces or prevents the activity of a protein kinase.

The compounds are therefore useful for conditions for which inhibition of protein kinase activity is beneficial. Thus, preferably, this aspect provides a compound

of the first aspect, or a composition of the third aspect of the present invention, for the prevention or treatment of a protein kinase-mediated disorder. The compounds of the first aspect of the invention may thus be used for the inhibition of protein kinase.

A "protein kinase-mediated disorder" is any disease or deleterious condition in which protein kinase plays a role. Examples include neurological disorder (including dementia), inflammatory disease, a disorder linked to apoptosis, particularly neuronal apoptosis; stroke, sepsis, autoimmune disease, destructive bone disorder, proliferative disorder, cancer, tumour growth, infectious disease, allergy, ischemia reperfusion injury, heart attack, angiogenic disorder, organ hypoxia, vascular hyperplasia, cardiac hypertrophy and thrombin induced platelet aggregation.

The compounds of the present invention are particularly useful for the prevention or treatment of a neurodegenerative disorder. In particular, the neurodegenerative disorder results from apoptosis and/or inflammation. Examples of neurodegenerative disorders are: dementia; Alzheimer's disease; Parkinson's disease; Amyotrophic Lateral Sclerosis; Huntington's disease; senile chorea; Sydenham's chorea; hypoglycemia; head and spinal cord trauma including traumatic head injury; acute and chronic pain; epilepsy and seizures; olivopontocerebellar dementia; neuronal cell death; hypoxia-related neurodegeneration; acute hypoxia; glutamate toxicity including glutamate neurotoxicity; cerebral ischemia; dementia linked to meningitis and/or neurosis; cerebrovascular dementia; or dementia in an HIV-infected patient.

The compounds of the invention can also be used to prevent or treat disorders resulting from inflammation. These include, for example, inflammatory bowel disorder, bronchitis, asthma, acute pancreatitis, chronic pancreatitis, allergies of various types, and possibly Alzheimer's disease. Autoimmune diseases which may also be treated or

prevented by the compounds of the present invention include rheumatoid arthritis, systemic lupus erythematosus, Sjögren syndrome, psoriatic arthritis, glomerulonephritis, scleroderma, chronic thyroiditis, Graves's disease, autoimmune gastritis, diabetes, autoimmune haemolytic anaemia, autoimmune neutropenia, thrombocytopenia, atopic dermatitis, chronic active hepatitis, myasthenia gravis, multiple sclerosis, ulcerative colitis, Crohn's disease, psoriasis or graft vs host disease.

A compound of the present invention may be administered simultaneously, subsequently or sequentially with one or more other active agent, such as an anti-inflammatory agent *e.g.* p38 inhibitor, glutamate receptor antagonist, calcium channel antagonist, a chemotherapeutic agent or an antiproliferative agent. For example, for acute treatment, a p38 inhibitor may be administered to a patient prior to administering a compound of the present invention.

The compounds of the invention will normally be administered in a daily dosage regimen (for an adult patient) of, for example, an oral dose of between 1 mg and 2000 mg, preferably between 30 mg and 1000 mg, *e.g.* between 10 and 250 mg or an intravenous, subcutaneous, or intramuscular dose of between 0.1 mg and 100 mg, preferably between 0.1 mg and 50 mg, *e.g.* between 1 and 25 mg of the compound of the formula I, or a physiologically acceptable salt thereof calculated as the free base, the compound being administered 1 to 4 times per day. Suitably the compounds will be administered for a period of continuous therapy, for example for a week or more.

In a seventh aspect, the present invention provides a method of treating or preventing a protein kinase-mediated disorder in an individual, which method comprises administering to said individual one or more compounds of the invention or a composition of the invention. The active compound is preferably administered in a

cumulative effective amount. The individual may be in need of the treatment or prevention. Any of the protein kinase-mediated disorders listed above in relation to the fifth aspect may be the subject of treatment or prevention according to the sixth aspect. One or more other active agent may be administered to the individual simultaneously, subsequently or sequentially to administering the compound. The other active agent may be an anti-inflammatory agent such as a p38 inhibitor, glutamate receptor antagonist, calcium channel antagonist, a chemotherapeutic agent or an antiproliferative agent.

In an eighth aspect, the present invention provides the use of a compound of the invention in the manufacture of a medicament for the prevention or treatment of a protein kinase-mediated disorder. The medicament may be used for treatment or prevention of any of the protein kinase-mediated disorders listed above in relation to the fifth aspect. Again, the compounds of the present invention may be administered simultaneously, subsequently or sequentially with one or more other active agent such as a p38 inhibitor.

In a ninth aspect, the present invention provides an assay for determining the activity of the compounds of the present invention, comprising providing a system for assaying the activity and assaying the activity of the compound. Preferably the assay is for the protein kinase inhibiting activity of the compound. The compounds of the invention may be assayed *in vitro*, *in vivo*, *in silico*, or in a primary cell culture or a cell line. *In vitro* assays include assays that determine inhibition of the kinase activity of activated protein kinase. Alternatively, *in vitro* assays may quantitate the ability of a compound to bind protein kinase and may be measured either by radiolabelling the compound prior to binding, then isolating the inhibitor/ protein kinase complex and

determining the amount of the radiolabel bound or by running a competition experiment where new inhibitors are incubated with protein kinase bound to known radioligands. An example of an assay which may be used is Scintillation Proximity Assay (SPA), preferably using radiolabelled ATP. Another example is ELISA. Any type or isoform of protein kinase may be used in these assays.

In a tenth aspect, the present invention provides a method of inhibiting the activity or function of a protein kinase, which method comprises exposing a protein kinase to a compound or a composition of the invention. The method may be performed in a research model, *in vitro*, *in silico*, or *in vivo* such as in an animal model. A suitable animal model may be a kainic acid model in rat or mice, traumatic brain injury model in rat, or MPTP in mice for neurodegenerative disorder and a collagen induced arthritis model in rat or mice, type II collagen-antibodies induced arthritis in mice, or a LPS induced endotoxin shock model in mice for inflammatory disease.

All features of each of the aspects apply to all other aspects *mutatis mutandis*.

Examples

The invention will now be explained in greater detail by the following examples, with the understanding that the scope of the invention is not in any sense restricted by these examples. The numbers assigned to each of the compounds in the examples correspond to the Compound Nos. of the compounds listed as specific examples in Tables A above. Structures of isolated novel compounds were confirmed by ^1H NMR and/or other appropriate analyses.

Compounds were characterised by mass spectrometry using single quadrupole instrumentation with an electrospray source. M+H indicates values obtained for

compound molecular mass (M) with proton (H) capture and M-H compound molecular mass (M) with proton (H) loss. Melting points (mp) are uncorrected; (d) denotes decomposition at or near the melting point. Compounds which were not solids were gums. The $^1\text{H-NMR}$ spectra (400 MHz, DMSO- d_6 or CDCl_3) of selected compounds of the invention were measured. The data for the chemical shifts (δ : ppm) and coupling constants (J : Hz) are shown. The "HPLC retention time" data for the compounds synthesized in the examples are the retention time for the compounds in HPLC analysis carried out under the following conditions.

EXAMPLE 1

[General Procedure for the Synthesis of Pyrazolo[1,5-a]pyrimidines of General Formula (VI)]

To a stirred solution of sodium ethoxide (50 mmol) in ethanol (100 mL) was added the appropriately 2-substituted malonic acid diester (20 mmol) and appropriately substituted 3-aminopyrazole (VII) (20 mmol). The mixture was heated at reflux for 18 h, during which a precipitate formed.* The reaction was cooled to room temperature and the mixture was filtered through an A4 sinter (whilst washing with a minimum of cool

ethanol). The residue was dried under vacuum. The dried precipitate was dissolved in water (ca. 100 mL) and the resulting solution was acidified (pH 2) with concentrated HCl. This rendered a pale-white precipitate (VI), which was filtered and dried. Typical unoptimised yields ranged from 20-40%.

*In several cases where the substituent was an alkyl chain, little or no precipitate was formed. In these situations, the ethanol was removed under reduced pressure. The residue was partitioned between water and ethyl acetate. The aqueous phase was acidified (pH 2) with concentrated HCl and back-extracted with ethyl acetate. The organic phase was washed (water and saturated aqueous NaCl) and dried (MgSO₄) to give the desired bis-hydroxy compound (VI).

[General Procedures for the Synthesis of Pyrazolo[1,5-*a*]pyrimidines of General Formula (IV) and (IV-01)]

a) To a solution of (appropriately substituted) 5,7-dichloropyrazolo[1,5-*a*]pyrimidine (V) or {5,7-dichloro(pyrazolo[1,5-*a*]pyrimidin-7-yl)}thiocarbonitrile and triethylamine (2 equivalents) in 2-propanol (20 mL) was added the amine R^3NH_2 (1 or 1.1 equivalents) and the mixture was stirred at room temperature overnight. The mixture was concentrated *in vacuo* and the residue was then partitioned between water and CH_2Cl_2 . The organic phase was washed twice with water and the combined aqueous phases back-extracted with CH_2Cl_2 . The organic layer was combined, washed with saturated aqueous NaCl and dried over Na_2SO_4 . Removal of the solvent *in vacuo* yielded the precursor (IV). [Purification performed - normally the products did not require any further purification, if they did, they were recrystallised. Analysis performed - $^1\text{H-NMR}$, HPLC and MS].

Should the above room-temperature reaction not occur satisfactorily, the following may be applied:

b) To a solution of the 5,7-dichloropyrazolo[1,5-*a*]pyrimidine (V) (2 g) in 2-propanol (25 mL) containing *N,N*-diisopropylethylamine (2 equivalents) was added the amine

R^3NH_2 (1.2 equivalents). The reaction was heated overnight at 80 °C and the solvent removed *in vacuo*. The residue was partitioned between water and CH_2Cl_2 and the organic phase was washed with water, saturated aqueous NaCl and dried over $MgSO_4$. Removal of the solvent *in vacuo* yielded the product (IV).

c) To a stirred suspension of sodium hydride (50 mmol) in *N,N*-dimethylformamide (30 mL) was added appropriately substituted aniline derivative (25 mmol) and then appropriately substituted 5,7-dichloropyrazolo[1,5-*a*]pyrimidine (V) (25 mmol) in tetrahydrofuran (50 mL). The resulting mixture was stirred at 50 °C for 2 h. The reaction was quenched with saturated aqueous NH_4Cl . After extraction with ethyl acetate, the combined organic layer was washed with saturated aqueous NaCl and dried over $MgSO_4$. The solvent was removed *in vacuo* to give the crude title compound (IV).

Typical unoptimised yields for d) 60 – 80 %.

d) To a solution of 2-chloroacetanilide (2.2 mmol) in toluene (3 mL) at room temperature was added sodium hydride (3 mmol) after the addition the mixture was heated until effervescence ceased and the solution became homogenous. The appropriately substituted 5,7-dichloropyrazolo[1,5-*a*]pyrimidine (V) (1 mmol) was added and the mixture heated at reflux for 5 h. (The solution became heterogeneous during this time). Upon cooling, acetic acid (1 mL) and water (1 mL) were cautiously added and the mixture was stirred for 15 min. The solvent was removed *in vacuo* and the residual acetic acid removed by azeotropic evaporation with toluene (3x). The residue was partitioned between water and ethyl acetate. The organic phase was washed (water and saturated aqueous NaCl) and dried. The solvent was removed *in vacuo* and the residue was chromatographed to afford the desired compound (IV). Typical unoptimised yields for c) 50 – 70 %. The R_f of starting material (V) and product (IV)

are chromatographically indistinguishable, making complete reaction difficult to determine. It appears that at least 5 h is required for significant reaction to occur.

EXAMPLE 35[General Procedure for Measurement of MAPKAP-K2 Enzyme Activity Inhibition](Compound preparation)

Compounds were dissolved in DMSO at a concentration of 10 mM and stored in aliquots at -20°C. Compounds in DMSO from these stock aliquots were diluted in DMSO to produce the required range of 30x stock solutions. These stock solutions were then subjected to 1:3 dilutions in order to prepare the required range of 10x stock solutions and 5 μ L of each solution was used per 50 μ L reaction. A final DMSO concentration of 3% was maintained throughout all compound dilution series to maximise compound solubility. Compounds were routinely tested at final concentrations ranging from 300 μ M to 0.001 μ M, but may have been tested at lower concentrations depending upon their activity.

(MAPKAP-K2 Assay)

The kinase reaction was conducted in a round-bottomed polypropylene 96-well plate. MAPKAP-Kinase 2 was diluted to 0.5 mU/ μ L in diluent buffer (50 mM Tris/HCl, pH7.5, 0.1 mM EGTA, 0.1% (v/v) β -mercaptoethanol, 1 mg/mL BSA). 5 μ L compound or 30% DMSO was added to each well followed by 25 μ L substrate cocktail (final concentration: 10 μ M ATP, 30 μ M peptide (KKLNRTLSVA), 0.5 μ Ci 33P- γ -ATP in 50 mM Tris pH7.5, 0.1 mM EGTA, 10mM Mg-acetate and 0.1% β -mercaptoethanol). The reaction was initiated with the addition of 20 μ L enzyme solution per well or 20 μ L diluent buffer without enzyme. The plate was shaken for 10 seconds and then left at room temperature for 30 minutes. The reaction was terminated with 50 μ L 150 mM phosphoric acid. 90 μ L of the reaction mixture was then transferred into a 96-well P81

filter plate (Whatmann) and incubated at room temperature for 5 minutes. The filter plate was then washed 4 times with 200 μ L 75 mM phosphoric acid per well on a plate vacuum manifold (Millipore) and dried in an oven for 2-3 hours. Packard MicroScint 'O' (30 μ L) was then added to each well, the plate was mixed for 30 minutes and subjected to liquid scintillation counting on a Packard TopCount.

After adding 25 μ L of peptide substrate solution [60 μ M substrate peptide, 20 μ M ATP, 50 mM Tris buffer (pH 7.5), 0.1 mM EGTA, 0.1 % β -mercaptoethanol, 20 mM magnesium acetate, 0.1 μ Ci [γ -33P]ATP (specific activity: approximately 110 TBq/mmol)] to 5 μ L of the test compound using 5% dimethylsulfoxide as the solvent, reaction was initiated by further addition of 20 μ L of a MAPKAP-K2 enzyme solution [10 mU recombinant human MAPKAP-K2, 50 mM Tris buffer (pH 7.5), 0.1 mM EGTA, 0.1 % β -mercaptoethanol, 0.1% BSA]. After conducting the reaction for 30 minutes at room temperature, an equivalent volume of a 200 mM phosphoric acid solution was added to suspend the reaction, and 90 μ L of the reaction product was adsorbed onto a MultiScreen PH plate (Millipore) and rinsed with a 100 mM phosphoric acid solution. After drying the plate, 30 μ L of MicroScint-O (Packard BioScience) was added, and the cpm was measured with a scintillation counter to determine the inhibiting activity. Substrate peptide is Lys-Lys-Leu-Asn-Arg-Thr-Leu-Ser-Val-Ala.

(Interpretation)

$$\% \text{ Control} = (X-B)/(Tot-B) \times 100$$

$$\% \text{ Inhibition} = 100 - \% \text{ Contr}$$

X = cpm of the test compound wells

B = cpm of wells without enzyme

Tot = cpm of wells with DMSO vehicle only

(MAPKAP-K2 inhibitory activity)

The efficacy of the compounds in Table A against MAPKAP-K2 is shown in Table C below.

(The activity is presented as +, ++, or +++ representing active, more active and very active based on assays conducted at typically 1 – 100 μ M).

EXAMPLE 36**[General Procedure for Measurement of CDK-1 Enzyme Activity Inhibition]****(Compound preparation)**

Compounds were dissolved in DMSO at a concentration of 10 mM and stored in aliquots at -20°C . Compounds in DMSO from these stock aliquots were diluted in DMSO to produce the required range of 30x stock solutions. These stock solutions were then subjected to 1:3 dilutions in order to prepare the required range of 10x stock solutions and 5 μL of each solution was used per 50 μL reaction. A final DMSO concentration of 3% was maintained throughout all compound dilution series to maximise compound solubility. Compounds were routinely tested at final concentrations ranging from 300 μM to 0.001 μM , but may have been tested at lower concentrations depending upon their activity.

(CDK-1 Assay)

The kinase reaction was conducted in a round-bottomed polypropylene 96-well plate. CDK-1 was diluted to 0.5 U/ μL in diluent buffer (50 mM Tris/HCl, pH7.5, 0.1 mM EGTA, 0.1% (v/v) β -mercaptoethanol, 1 mg/mL BSA). 5 μL compound or 30% DMSO was added to each well followed by 25 μL substrate cocktail (final concentration: 10 μM ATP, 50 μM peptide (HSTPPKKKAK), 0.5 μCi ^{33}P - γ -ATP in 50 mM Tris-HCl (pH 7.5), 1 mM EGTA, 2 mM DTT, 10 mM MgCl_2 , 0.01% Brij-35). The reaction was initiated with the addition of 20 μL enzyme solution per well or 20 μL of diluent buffer without enzyme. The plate was shaken for 10 seconds and then left at room temperature for 15 minutes. The reaction was terminated with 50 μL 150 mM phosphoric acid. 90 μL of the reaction mixture was then transferred into a 96-well P81

filter plate (Whatmann) and incubated at room temperature for 5 minutes. The filter plate was then washed 4 times with 200 μ L 75 mM phosphoric acid per well on a plate vacuum manifold (Millipore) and dried in an oven for 2-3 hours. Packard MicroScint '0' (30 μ L) was then added to each well, the plate was mixed for 30 minutes and subjected to liquid scintillation counting on a Packard TopCount.

EXAMPLE 37

[General Procedure for Measurement of CDK-2 Enzyme Activity Inhibition]

(Compound preparation)

Compounds were dissolved in DMSO at a concentration of 10 mM and stored in aliquots at $-20^{\circ}C$. Compounds in DMSO from these stock aliquots were diluted in DMSO to produce the required range of 30x stock solutions. These stock solutions were then subjected to 1:3 dilutions in order to prepare the required range of 10x stock

solutions and 5 μL of each solution was used per 50 μL reaction. A final DMSO concentration of 3% was maintained throughout all compound dilution series to maximise compound solubility. Compounds were routinely tested at final concentrations ranging from 300 μM to 0.001 μM , but may have been tested at lower concentrations depending upon their activity.

(CDK-2 Assay)

a) The kinase reaction was conducted in a round-bottomed polypropylene 96-well plate. CDK-2 was diluted to 0.5 ng/ μL in diluent buffer (50 mM Tris/HCl, pH7.5, 0.1 mM EGTA, 0.1% (v/v) β -mercaptoethanol, 1 mg/ml BSA). 5 μL compound or 30% DMSO was added to each well followed by 25 μL substrate cocktail (final 10 μM ATP, 0.1 mg/ml Histone type III-S, 0.2 μCi ^{33}P - γ -ATP in 50 mM Tris-HCl (pH 7.5), 1 mM EGTA, 2 mM DTT, 10 mM MgCl_2 , 0.01% Brij-35). The reaction was initiated with the addition of 20 μL enzyme solution per well or 20 μL of diluent buffer without enzyme. The plate was shaken for 10 seconds and then left at room temperature for 60 minutes. The reaction was terminated with 50 μL 150 mM phosphoric acid. 90 μL of the reaction mixture was then transferred into a 96-well P81 filter plate (Whatmann) and incubated at room temperature for 5 minutes. The filter plate was then washed 4 times with 200 μL 75 mM phosphoric acid per well on a plate vacuum manifold (Millipore) and dried in an oven for 2-3 hours. Packard MicroScint '0' (30 μL) was then added to each well, the plate was mixed for 30 minutes and subjected to liquid scintillation counting on a Packard TopCount.

After adding 25 μL of substrate solution [0.2 mg/ml Histone type III-S, 20 μM ATP, 100 mM Tris buffer (pH 7.5), 2 mM EGTA, 4 mM DTT, 0.02 % polyoxyethylene

lauryl ether (23 Lauryl Ether; Brij 35), 20 mM magnesium chloride, 0.2 μCi [γ - ^{33}P]ATP (specific activity: approximately 110 TBq/mmol)] to 5 μL of the test compound using 5% dimethylsulfoxide as the solvent, reaction was initiated by further addition of 20 μL of a CDK2 enzyme solution [2.5 mU recombinant human CDK2/cyclin A, 50 mM Tris buffer (pH 7.5), 0.1 mM EGTA, 0.1 % β -mercaptoethanol, 0.1% BSA]. After conducting the reaction for 15 minutes at room temperature, an equivalent volume of a 70 % trichloroacetic acid (TCA) solution was added to suspend the reaction, and 90 μL of the reaction product was adsorbed onto a MultiScreen HV plate (Millipore) and rinsed with a 25 % TCA solution. After drying the plate, 30 μL of MicroScint-O (Packard BioScience) was added, and the cpm was measured with a scintillation counter to determine the inhibiting activity.

Industrial Applicability

The Pyrazolo[1,5-a]pyrimidine derivatives represented by formula I and their pharmaceutically acceptable salts exhibit excellent kinase inhibiting activity (particularly MAPKAP-K2 inhibiting activity). Drugs comprising the compounds as effective ingredients are therefore expected to be useful as therapeutic or prophylactic agents for a protein kinase mediated disorder in which kinase is implicated, such as such as inflammatory disease, autoimmune disease, destructive bone disorder, cancer and/or tumour growth.

ABSTRACT

The Pyrazolo[1,5-a]pyrimidine derivatives represented by formula I and their pharmaceutically acceptable salts exhibit excellent kinase inhibiting activity. Drugs comprising the compounds as effective ingredients are therefore expected to be useful as therapeutic or prophylactic agents for a protein kinase mediated disorder in which kinase is implicated, such as inflammatory disease, autoimmune disease, destructive bone disorder, cancer and/or tumour growth.

Box No. II Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: 90-95, 103-104
because they relate to subject matter not required to be searched by this Authority, namely:
Claims 90-95 and 103-104 pertain to a method for treatment of the human body by therapy.
2. ☐ Claims Nos.:
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
3. ☐ Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box No. III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

This application contains the following inventions or groups of invention which are not so linked as to form a single inventive concept under PCT Rule 13.1.

As the common chemical structure of Groups I-IV is not new (for example, WO 99/38868 A1 <RN:202579-57-5 etc.>, JP 3-204877 A <RN:137739-28-7 etc.> and so on), Groups I-IV lack the same or corresponding special technical features under PCT Rule 13.2.

Group I : Claims 1-38, 52-89, 96-102

Group II : Claim 39, 42-45, 46-47, 48, 49 (a compound of formula II-26)

Group III : Claim 40, 42-45, 48, 50 (a compound of formula III-01)

Group IV : Claim 41, 42-45, 48, 51 (a compound of formula IV)

1. ☐ As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.
2. ☒ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
☐ No protest accompanied the payment of additional search fees.
